Abstract: The oil and gas sector has found itself amidst the twin crises of COVID-19 and price war and these are perceived to impact sector's quoted stocks. In this paper, Vector Autoregression (VAR) technique was applied to determine the nexus between covid-19 (fatal, recovery and positive) cases, and oil and gas stock index in Nigeria using 43 weeks' data sets from March 2 to December 27, 2020. This study found no long-run relationship between covid-19 and oil and gas stock index in Nigeria. Moreover, Covid-19 recovery cases (lag 1) have negative and non-significant effect on oil and gas stock index in Nigeria while its lag 2 coefficient is positive and statistically significant. In the same vein, covid-19 positive cases (lags 1 and 2), have positive but non-significant effects on oil and gas stock index in Nigeria. Moreover, covid-19 fatal cases (lag 1) and oil and gas stock index have negative and non-significant relationship while the lag 2 coefficient is positive but non-significant. This study posits that there is a positive and significant relationship between covid-19 recovery cases and oil and gas stock index in Nigeria. This implies that the rate of recoveries from covid-19 poses a good sign to the oil and gas stock performance in Nigeria. The study recommends that Government should make available to the public, covid-19 vaccine to stimulate resilience to and recovery from the disease (for those infected). There is also the need for public confidence building campaigns, workshops, and other measures to stimulate capital market activities.

Introduction

The oil and gas industry is an important sector of the economy given its ability to provide gainful employment and contributes to basic services like security, health and education, and servicing of foreign debts in addition to being a viable source of foreign exchange earnings. Nigeria is an oil-dependent country and the oil and gas sector has made moderate contributions to the country's economic growth over time. For instance, statistics (Central Bank of Nigeria, 2019) shows that the crude petroleum and natural gas sector in Nigeria contributed to the nominal Gross Domestic product (GDP) at a rate of 5.92 billion Naira in 1981, and at average of N12.17777b in the 80s. In 1990, 58.06 Billion Naira was the sector's contribution to the growth of the nation's economy. The average of the 90s stands at N328.9914b while in year 2000 specifically, the sector contributed 1,266.67Billion Naira to Nigeria's nominal GDP. In the 20s, the sector has a contribution of N2858.124Billion to Nigeria's GDP. Furthermore, in year 2010, the contribution of oil and gas to the country's GDP stood at N8,402.68b, while between 2010 and 2019, the average contribution of oil and gas sector to Nigeria's GDP was N9820.792b. Specifically, in 2019, N12,400.43b is the sector's contribution to Nigeria's GDP.

In spite of these trends of contributions of the oil and gas industry to economic growth, the sector according to KPMG (2020), has been affected recently by the twin shocks of the COVID-19 pandemic and the crude oil price war. These shocks as explained further by the author, resulted in a further collapse of crude oil prices, and a crash in the price of futures, which has continued to impact negatively on the global Oil and Gas Industry, manifesting in lower profitability and liquidity positions. Nigeria has her own share of the painted events in the global market for petroleum products due to the fact that most of the hydrocarbons produced in Nigeria are exported as well the nation's dependence on proceeds from the sale of crude oil and gas (KPMG, 2020).

The coronavirus disease 2019 (COVID-19) broke out in Wuhan, Hubei Province, China in late December 2019 and has since then spread to over 200 countries including Nigeria. Nigeria had her first recorded case on 27th February 2020 and from this date, the virus has continued to spread to different parts of Nigeria, including all the 36 states and the Federal Capital Territory (FCT). The World Health Organization (WHO) declared the COVID- 19 as a pandemic on 11th March 2020. The Nigeria Centre for Disease (NCDC) (2020) situation reports has it that, as at 27th December

2020, the number of new confirmed cases of COVID-19 is 5,908 while the count of discharged cases stands at 2,731. Cumulatively, there have been 1,254 deaths reported with a case fatality rate (CFR) of 1.5% in Nigeria. In Africa, the count for confirmed COVID-19 cases is 2,644,112 with 62,366 deaths resulting in a case fatality rate of 2.4% as at 27th December 2020. On the same date, globally, the number of confirmed COVID-19 cases is 79,232,555 with 1,754,493 deaths resulting in a case fatality rate of 2.2% globally.

The outbreak of COVID-19 has shaken the global financial markets, commodity markets, economic activities, employment and GDP of different countries (Meher *et al.*, 2020). Specifically, COVID-19 causes fear and additional stress on financial markets, where the price volatility is continuously increasing (Albulescu, 2020). In Nigeria, no sector of the economy is left unscathed by the effects of the pandemic. A case in point is the oil and gas industry which is hit by double tragedy of the coronavirus pandemic and oil price war. During the pandemic, the oil market is coincidentally weak and prices are under pressure. Furthermore, as the number COVID-19 confirmed cases and its attendant risk to the general public, investors would shape their sentiments towards the disease, which could significantly influence the stock market (Takyi & Bentum-Ennin, 2020). The information-driven nature of the stock market, makes information coronavirus pandemic to be of potential influence on the performance of the market. Camp *et al.* (2020) observe that the pandemic affected energy prices for products such that the onset of the pandemic led to an initial drop in prices for petroleum-based products, and then, just as abruptly, prices rose sharply as producers limited production and demand increased. Abegunde *et al.* (2020) note that in addition to the country-wide economic impact of COVID-19 in Nigeria, crude producers are faced with a decline in both price and demand for crude, resulting in an oil glut. Research have shown that activities in the real sector of the economy, especially those that have direct bearing on the sector value and operation do tell on the financial performance as well the stocks of the companies in the said industry.

Empirically, the impact of coronavirus has been examined in terms of its effect on capital market performance generally. For instance, Chaouachi and Chaouachi (2020) investigated covid-19 impact on Saudi stock market. Ngwakwe, (2020) also evaluated the effect of Covid-19 pandemic on global stock market values. In Nigeria, however, most of the few available studies focused on the nexus between COVID-19 and stock prices (Babarinde (2020a); market capitalization (Alade *et al.* (2020), Babarinde *et al.*

(2020); equity turnover (Babarinde (2020b); market performance (Adenomon *et al.*,2020). Ikwuagwu *et al.* (2020) focused on the effect of coronavirus on returns for health firms in Nigeria. Research on sectorial analysis of the effects of the pandemic on Nigerian capital market appears relatively scarce. Hence, the motivation for this current study, considered as one of the pioneer studies on the effects of positive (confirmed), fatal (death) and recovery (discharged) cases of coronavirus disease on the performance of oil and gas stocks listed on the Nigerian Stock Exchange(NSE).

The main aim of this study was to explore the effects of COVID-19 on oil and gas stock index in Nigeria between March 2 to December 27, 2020 using Vector Autoregression(VAR) technique. The specific objectives, however, are to determine whether or not there is a long run relationship between covid-19 and oil and gas stock index in Nigeria; and this also study seeks to evaluate the effects of covid-19 (fatal, recovery and positive) cases on oil and gas stock index in Nigeria.

The study sought to answer the following questions:

1. Is there any long run relationship between covid-19 and oil and gas stock index in Nigeria?
2. What is effect of COVID-19 fatal (death) cases on oil and gas stock index in Nigeria?
3. What is effect of COVID-19 recovery (discharged) cases on oil and gas stock index in Nigeria?
4. What is effect of COVID-19 positive (confirmed) cases on oil and gas stock index in Nigeria?

The other parts of this paper contains the following parts in the following order: literature review, methodology, results and discussions, and conclusion and recommendations.

Literature Review

Afaha *et al.* (2020) examined the impact of COVID-19 on the price of oil and gas products in the international market. The findings revealed that crude oil prices had reduced to record low of \$22 per barrel and this obviously has revenue impacting effects on the Nigeria economic system.

In another study, Aloui *et al.* (2020) assessed the impact of COVID-19 shocks on the energy futures markets, particularly on crude oil and natural gas S&P GS

Indexes. The findings reveal that energy commodities S&P GS indexes respond to COVID-19 shock that varying over time due to fundamentals factors as well as behavioral and psychological factors.

Moreover, Albulescu (2020) investigated the impact of COVID-19 numbers on crude oil prices, while controlling for the impact of financial volatility and the United States economic policy uncertainty. The study shows that the COVID-19 daily new confirmed cases have a marginal negative impact on the crude oil prices in the long run. In the same vein, Aruna and Rajesh (2020) determined the impact of COVID 19 cases and sources of oil price shock on Indian stock returns. The study revealed that COVID-19 has positive and statistically significant on stock returns in the country.

Takyi and Bentum-Ennin (2020) evaluates the short-term impact of the COVID-19 on stock market performance in thirteen African countries, including Nigeria. Stock market performances in Africa have significantly reduced during and after the occurrence of the COVID- 19,

In a study on effect of Covid-19 100thday information on health firms' stock returns in Nigeria, Ikwuagwu *et al.* (2020) showed an evidence of a positive abnormal return for health firms in Nigeria. Adenomon *et al.* (2020) examined the effects of the COVID-19 pandemic on Nigerian's stock exchange performance. They found that COVID-19 has negative effects on the stock market returns in Nigeria.

The empirical review exposes the perceived lacuna in empirical literature on the effects of COVID-19 cases on oil and gas stock index in a developing country, such as Nigeria. The oil and gas sector is examined in this study considering the dependency of the Nigerian economy on the sector.

Methodology

In this paper, the effects of positive, recovery and fatal cases of coronavirus disease on oil and gas stock index were investigated using Nigeria's weekly data sets covering 43 weeks, from March 2 to December 27, 2020. Data on coronavirus disease were sourced from NCDC (2020) while data on oil and gas stock index were obtained from NSE websites. This study is a based on event study methodology in line with similar previous studies (such as Babarinde (2020), Liu *et al.* (2020)). In line with Alade *et al.* (2020) and Babarinde (2020a), this study applied Vector Autoregression (VAR) technique to the analysis of the link between oil and gas stock index and COVID-19 cases in Nigeria.

Drawing from the works of Babarinde (2020a) and Ahmed (2020), this study specified the functional relationship between coronavirus (positive, recovery and fatal) cases and oil and gas stock prices, measured as the weekly Nigerian Stock Exchange (NSE) Oil and Gas index as follows (1).

$$OGI_t = \beta_0 + \beta_1 CNNP_t + \beta_2 CNNF_t + \beta_3 CNNR_t + U_t \quad (1)$$

This current study employs the multivariate Vector Autoregressive method (VAR). The VAR models for this study are specified in equations (2) to (5) below.

$$OGI_t = \beta_0 + \beta_1 OGI_{t-1} + \beta_2 CNNP_{t-1} + \beta_3 CNNF_{t-1} + \beta_4 CNNR_{t-1} + U_{1t} \quad (2)$$

$$CNNP_t = \beta_0 + \beta_1 OGI_{t-1} + \beta_2 CNNP_{t-1} + \beta_3 CNNF_{t-1} + \beta_4 CNNR_{t-1} + U_{2t} \quad (3)$$

$$CNNF_t = \beta_0 + \beta_1 OGI_{t-1} + \beta_2 CNNP_{t-1} + \beta_3 CNNF_{t-1} + \beta_4 CNNR_{t-1} + U_{3t} \quad (4)$$

$$CNNR_t = \beta_0 + \beta_1 OGI_{t-1} + \beta_2 CNNP_{t-1} + \beta_3 CNNF_{t-1} + \beta_4 CNNR_{t-1} + U_{4t} \quad (5)$$

Where;

OGI_t indicates the weekly closing prices of oil and gas stocks at the Nigerian Stock Exchange,

$CNNP_t$ denotes the weekly new number of confirmed cases of COVID-19 in Nigeria,

$CNNR_t$ represents the weekly new number of COVID-19 recovery cases in Nigeria,

$CNNF_t$ signifies the new number of weekly COVID-19 fatal cases

U_{1t} to U_{4t} denote the error terms.

β_0 – β_4 are the short-run dynamic coefficient of the model adjustment; and

t = March 2 to December 27, 2020.

Data Analysis and Empirical Results

Descriptive Statistics

To have a preliminary understanding of the statistical properties of the variables of study, the descriptive statistics are presented in Table 1. The descriptive Statistics reveal the average oil and gas stock index in the Nigerian Stock Exchange to be 206.1728 points in the 43 weeks of study. The average weekly cases of covid-19 new fatalities, positives and recoveries are around 6, 807 and 639. Based on Jarque-Bera test, the three indicators of covid-19 (CNNF, CNNP and CNNR) are not normally distributed while Oil and Gas Stock Index is passes the normality test. The stock Index is not widely dispersed from its mean value unlike the three indicators

of covid-19 which exhibit wide dispersion from the average values. Unlike the oil and gas stock index which is negatively skewed, all the three measures of covid-19 in this study are positively skewed.

Unit Roots Tests

The unit root tests by way of augmented Dickey-Fuller (ADF) and Phillips-Perron tests are applied to the variables of study in order to avoid spurious results. Both ADF and PP results as presented in Table 2 show oil and gas stock index (OGI), covid-19 new fatal cases (CNNF), and covid-19 new positive cases (CNNP) to be stationary at first difference while covid-19 new discharged/recovery cases (CNNR) attains stationary in its level form.

Table 2: Unit Roots Tests

	<i>ADF</i>	<i>p-value</i>	<i>I(d)</i>	<i>Remarks</i>
OGI	-7.039057	0.0000	I(1)	Stationary
CNNF	-11.12851	0.0000	I(1)	Stationary
CNNP	-3.697353	0.0078	I(1)	Stationary
CNNR	-3.570170	0.0107	I(0)	Stationary
	PP	p-value	I(d)	Remarks

Cointegration Tests

Whether or not a long-run relationship exists between covid-19 and oil and gas stock index in Nigeria was examined via Johansen cointegration test and F-Bounds. The results of the cointegration tests as presented in Table 3, indicate lack of cointegration between oil and gas stock index and covid-19 new positive cases; between oil and gas stock index and covid-19 new recovery cases; and between oil and gas stock index and covid-19 new fatal cases. Similarly, oil and gas stock index and covid-19 new positive cases, fatal cases and recovery cases in Nigeria are not cointegrated. By these results, this study has established that there is no long-run relationship between covid-19 (fatal, positive and recoveries) and oil and gas stock index in Nigeria. This implies that the connection between COVID-19 and oil and gas stock index seems to exist in the short-run. Hence, the effects, relationship and implications of the pandemic on oil and gas stock index in Nigeria is for short-run only.

Vector Autoregression Results

Vector Autoregression (VAR) technique was applied to the empirical analysis of the effects of COVID-19 (fatal, recovery and positive) cases on oil and gas stock index in Nigeria. Thus, the VAR results displayed in Table 4 indicate that covid-19 positive cases (lag 1) have negative but non-significant relationship while the its lag 2 coefficient is positive but statistically non-significant effect on oil and gas stock index in Nigeria. Moreover, covid-19 fatal cases (lag 1) have negative and non-significant effect on oil and gas stock index in Nigeria. Furthermore, covid-19 recovery cases (lag 1) have negative and non-significant effect on oil and gas stock index in Nigeria.

Finally, on the relationship between oil and gas stock index and covid-19 positive, fatal and recovery cases, VAR shows that covid-19 recovery cases (lag 1) have negative and non-significant effect on oil and gas stock index in Nigeria while lag 2 coefficient of covid-19 recovery cases have positive and statistically significant effect on oil and gas stock index in Nigeria. In the same vein, covid-19 positive cases (lags 1 and 2), are positively associated with oil and gas stock index in Nigeria but this connection is not statistically significant. This study also established that covid-19 fatal cases (lag 1) have negative and non-significant effect on oil and gas stock index in Nigeria while its lag 2 coefficient is positive but statistically non-significant related with oil and gas stock index in Nigeria in the period of investigation.

Conclusion and Recommendations

Vector Autoregression technique was applied to the empirical analysis of the nexus between covid-19 (fatal, recovery and positive) cases and oil and gas stock index in Nigeria using a 43-week data sets beginning from March 2 to December 27, 2020. This study has empirically established via cointegration tests, that there is no long-run relationship between covid-19 (fatal, positive and recoveries) and oil and gas stock index in Nigeria in the study period.

The Vector Autoregression results on the relationship between oil and gas stock index and covid-19 positive cases, VAR indicates that covid-19 positive cases (lag 1) have negative and non-significant relationship while the its lag 2 coefficient is positive but statistically non-significant. Moreover, on the relationship between oil and gas

stock index and covid-19 fatal cases, VAR indicates that covid-19 fatal cases (lag 1) have negative and non-significant relationship. Furthermore, on the relationship between oil and gas stock index and covid-19 recovery cases, VAR indicates that covid-19 recovery cases (lag 1) have negative and non-significant relationship.

Finally, on the relationship between oil and gas stock index and covid-19 positive, fatal and recovery cases, VAR shows that covid-19 recovery cases (lag 1) have negative and non-significant relationship while its lag 2 coefficient is positive and statistically significant. In the same vein, covid-19 positive cases in both lags 1 and 2, are positively associated with oil and gas stock index in Nigeria but this connection is not statistically significant. VAR indicates that covid-19 fatal cases (lag 1) have negative and non-significant relationship while its lag 2 coefficient is positive but statistically non-significant.

This study therefore concludes that covid-19 recovery cases (lag 2) have positive and statistically significant relationship. This implies that the rate of discharged/recovery from the covid-19 cases poses a good sign to oil and gas stock performance in the Nigerian Stock Exchange. Covid-19 positive and fatal cases do not have significant relationship with oil and gas stock index in Nigeria.

The study recommends that Government should make available covid-19 vaccine to stimulate resilience to and recovery from the disease (for those infected). Public confidence building campaigns, enlightenment, programmes, workshops, as well as other measures like capital market intervention funds be available to the capital market community and the generality of the public so as to encourage capital market activities by the people.
