Abstract: Most of the researchers are examining the wage gap between males and females. Most number of researchers is saying that many firms have this kind of issues regarding the gender gap impact into hourly wages. As a third world country, it is very important to examine the impact of gender gap into hourly wages in Sri Lanka. In this study the researcher has used a sample of three thousand employees of private sector companies in Sri Lanka to evaluate the salary difference of males and females. The data has been collected by using a questioner through online method. Working hours, income and other demographic information were collected for the analysis. Different statistical methods were used to evaluate the data. According to this study, the test p-value is higher than the 0.05 significance value. Mean hourly wage of the men and female around 524 and 550 accordingly. According to the test statistic values, the hourly wage of men and female are different, and according to the mean values of the two groups, women earn more than men.

Keywords: Gender gap, hourly wage, t-test

1. INTRODUCTION

Much investigation on disparities in income between men and women has failed to clarify the complete wage disparity as a result of a calculated divergence. Some researchers consider the unexplained residuals to be evidence of sexism against women employees, and others suggest that variations in labour supply may explain the entire wage gap (Hersch, 1991). A researcher, Sanborn, said discrimination should not be treated with discrimination resulting from job barriers, except in the case of equal pay for equal jobs. Sanborn adjusted the income ratio for delivery, annual hours
of labour, training, urbanity, race, turnover, absence and working experience, using both male and female adjustment weights (Oaxaca, 1973).

This study focuses on the hourly wages of men and women to analyse the wage differences between these two gender categories. Three thousand of employees of private sector companies in Sri Lanka were used as the sample to collect the data. This study enables the community to know that the difference in hourly wage based on gender.

2. LITERATURE REVIEW

While economists are long aware that women are not paying the same average salary as men, their efforts to justify this disparity were less than satisfactory, typically leaving a significant component unanswered which may or may not be attributable to “discrimination.” The gender of the worker is one potential explanation for different preferences. On average, men and women say that they vary in their work characteristics. Due above mention factor there is a clear cut division of hourly wage between men and women (Filer, 1985). Important determinants of the wages gap are variables deriving from the role of women in the household. Furthermore, higher women’s turnover or departure rates (and thus their shorter projected period with a company) compared to men help to minimize this difference, partially because women and their employers have less desire to invest in training (Royalty, 1996). However, a significant part of their higher turnover reflects the fact that women work predominantly in high-speed enterprises, businesses and sectors. However, it is important to point out that for non-monetary reasons such as household and family welfare, women prefer to quit and leave the workforce, while men tend to abandon for better jobs (Sicherman, 1996). In unionized settings, certain companies’ pay disparities appear to be lower, presumably reflecting the impact of a union on the reduction of compensation structures and implementation of anti-discussion legislation. But it’s not in some business (Doiron & Riddell, 1994). Therefore, there is a wage difference base on gender.

3. METHODOLOGY

Two sample t-test hypothesis testing method used as the statistical model to interpret the results. gender was used as the grouping variable. Hourly wage was used as the dependent variable. By using STATA 13 version calculate the p-value for the two-sample t-test.

3.1. Hypothesis

H0: there is no any difference between hourly wage between males and females ($\mu_{\text{female}} - \mu_{\text{male}} = 0$)
H1: there is a difference between hourly wage between males and females 
(\(\mu_{\text{female}} - \mu_{\text{male}} \neq 0\))

3.2. Abbreviations

\(\mu_{\text{male}}\): - Males, mean value of the hourly wage
\(\mu_{\text{female}}\): - Female, mean value of the hourly wage
wage: - Hourly wage of employees
wagefe: - Hourly wage of female
wagema: - Hourly wage of male

4. DESCRIPTIVE STATISTICS

<table>
<thead>
<tr>
<th>Table 1: Descriptive Statistics of Income and Working Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Number of Observations : 3000</td>
</tr>
<tr>

</tr>
<tr>
<td>Std.Dev.</td>
</tr>
<tr>
<td>Variance</td>
</tr>
<tr>
<td>Skewness</td>
</tr>
<tr>
<td>Kurtosis</td>
</tr>
</tbody>
</table>

Above figure describe the descriptive statistics of income and the working hours of the employees. Mean value of the income of all the employees around 30973. Mean value of the working hours of the employees around 50 hours. Skewness and kurtosis value provides an idea about those two variables. Those two values are higher than two. Therefore those two variables are positively skewed.

<table>
<thead>

</tr>
</tbody>
</table>

Hourly wage calculated by dividing income by the working hours and the newly created variable called as wage. Above figure describes the mean, variance and skewness of age and the wage. Mean value of the wage around 649 and the mean age of the selected group around 40 years.
5. ANALYSIS

The wage of male and females having several outliers. before involving in to further analyzing the outliers should be removed. They heavily influence the final results.
Above bar chart representing the relative employees as gender. In this sample, more male employees are working than female employees.

Figure 3: Relative abundance of gender

Figure 4: Income of the employees
Above figure describes the frequencies of income of the total employees working in this particular sector. The income of the most number of employees around between 100 to 100000.

![Figure 5: Working hours of the employees](image)

Above figure shows the frequencies of hours that all the employees working at this particular sector. Most numbers of employees are working at least 50 hours per month.

![Figure 6: Mean wage of males and females](image)
Females mean wage higher than the mean wage of men.

### Table 3: Two-sample t-test results

<table>
<thead>
<tr>
<th>Variable</th>
<th>Obs</th>

</thead>
<tbody>
<tr>
<td>Wage (Female)</td>
<td>1003</td>
<td>524.0784</td>
<td>10.818</td>
<td>342.613</td>
</tr>
<tr>
<td>Wage (Male)</td>
<td>1829</td>
<td>550.8499</td>
<td>6.096</td>
<td>260.7004</td>
</tr>
<tr>
<td>Combined</td>
<td>2832</td>
<td>541.3684</td>
<td>5.498</td>
<td>292.5679</td>
</tr>
<tr>
<td>Diff</td>
<td></td>
<td>-26.77155</td>
<td>11.4862</td>
<td></td>
</tr>
</tbody>
</table>

\[ t = -2.3308 \]

Above figure describe the results of the two-sample t-test. test p-value less than 0.05. therefore, the alternative hypothesis is accepted.

First, the researcher calculated the wage by using income and the working hours. Then divided the wage base on gender. After that, the researcher identified the outliers of the newly created variables. An outlier is a remark which lies in a random population sample an abnormal distance from other values. In a way, it is up to the analyst to determine what is considered abnormal. Outliers are highly influencing to the final results. Therefore, the outliers should be removed before analyze the data set. After removing the outliers, the researcher preformed the two-sample t-test.

**HYPOTHESIS**

H0: there is no any difference between hourly wage between males and females \((\mu\text{ female} - \mu\text{ male} = 0)\)

H1: there is a difference between hourly wage between males and females \((\mu\text{ female} - \mu\text{ male} \neq 0)\)

The test p-value of the test less than 0.05 value (\(\alpha\)-value for the test = 0.05). Therefore, the study rejects the null hypothesis and accepts the alternative hypothesis. There is a difference between hourly wage between males and females. According to the mean values, women earns more than men.

6. **CONCLUSION AND RECOMMENDATIONS**

According to the study, there is a clear difference in the hourly wage of men and women. Women hourly wage is higher than the hourly wage of men. Therefore, the study conclude that there is no gender discrimination into female workers through hourly wage gap in private sector firms in Sri Lanka.

This study enables to study the wage different of men and women. This kind of research should be done for several firms to get an idea about the overall population.
